Dual Tasking in People Living with Multiple Sclerosis

We are inviting adults aged 18+ with multiple sclerosis and adults with no history of neurological conditions to participate in a research study investigating how people do two things at once (i.e., dual task).

If you are eligible and decide to participate, you will complete one study session of approximately 3 hours that involves performance of various motor and cognitive tasks and an assessment of nervous system excitability.

If you are interested, please contact:
